A deployment starts in the Pending state until an operator approves it.

Only operators with the release role may approve a deployment.

The deployment stops when the health check fails three consecutive times.

Health checks run every 20 seconds during rollout.

A rollout begins with ten percent of instances.

The rollout advances to all instances only after five minutes of healthy checks.

Rollback restores the previously deployed application version.

Rollback does not reverse database migrations.

A database backup is required before a deployment that includes a migration.

Deployment logs are retained for 14 days.

A maintenance window prevents automatic deployments from starting.

A deployment already in progress continues when a maintenance window begins.
